PROFESSIONAL SUMMARY

Senior Backend Engineer with 5 years of experience building high-throughput distributed systems and scalable B2B SaaS platforms handling 10K+ TPS. Skilled in Java, Spring Boot, Kafka, Redis, Kubernetes, and AWS, with strong expertise in microservices, event-driven architecture, low-latency systems, cloud-native infrastructure, and high-availability backend platforms. Experienced in scalability, JVM performance tuning, asynchronous processing, and reliability engineering.

TECHNICAL SKILLS

Programming Languages: Java (primary), SQL, Python, C++, Bash.

Databases & Caching: MySQL, PostgreSQL, NoSQL (Cassandra, DynamoDB, Redis, MongoDB), Elasticsearch, Database Optimization.

Backend & Messaging: Spring Boot, Spring Cloud, JPA, Hibernate, REST APIs, gRPC, Kafka, RabbitMQ, Junit.

Cloud and DevOps: Kubernetes, Docker, Helm, AWS (EC2, RDS, EKS, ElastiCache), Jenkins, CI/CD, Git, GitLab, Azure, Autoscaling.

Design and Architecture: Microservices, Event-Driven Architecture, Async Processing, Idempotency, CQRS, API Gateway, Fault Tolerance, Scalability, Circuit Breaker, Resilience4j, OAuth, JWT.

Observability & Reliability: Splunk, Prometheus, Grafana, Performance Tuning, SLA/SLO, Distributed Tracing, Agile/Scrum.

PROFESSIONAL EXPERIENCE

Gupshup Technology Pvt. Ltd.,

Bengaluru, India

Software Development Engineer 2: | June 2023 – Present

- **Designed and owned** a high-throughput, high-availability, fault-tolerant RCS onboarding and messaging platform (**Spring Boot, Kafka, Redis**) with **Splunk-based logging and monitoring**, and deployed on **Kubernetes**, handling **10,000 TPS** in production.
- **Redesigned** a legacy, MySQL-based AWS RDS billing workflow into a low-latency, event-driven billing pipeline using Redis and Spring Boot, reducing billing latency to **20 ms** and eliminating AWS RDS infrastructure costs.
- **Led** a large-scale, zero-downtime migration of **1,000+** enterprise clients across India and abroad from a legacy platform to a modern, scalable architecture, ensuring backward compatibility, template validation, and zero-downtime production rollout.
- **Led** the design and implementation of a real-time chat system, collaborating with **7 teams**, using **WebSocket** and **RabbitMQ pub-sub architecture**, achieving **67%** efficiency improvement with a custom load balancer using consistent hashing.
- **Containerized and orchestrated** services using Docker and Kubernetes for development and QA environments, reducing setup time by **90%** and infrastructure costs by **40%** through on-demand environment provisioning.
- **Reduced** AWS infrastructure costs by **\$4.8K per month** through resource optimization, including instance right-sizing, termination of idle workloads, and standardized golden images.
- **Mentored 8 junior** engineers; improved code reliability through code reviews, design walkthroughs, and testing practices, reducing production defects by **85%**.

Software Development Engineer 1: | June 2021 – June 2023

Bengaluru, India

- **Resolved** a critical RabbitMQ consumer reconnection issue through **root cause analysis**; implemented **idempotent** consumer processing and resilient retry handling, eliminating a **30-minute** processing backlog.
- **Launched self-serve platforms** for IG and GBM by collaborating with cross-functional stakeholders to gather requirements and communicate solutions using JAX-RS, RabbitMQ, and MySQL, reducing client onboarding time by **70%**.
- **Built** a messaging router using **Apache Camel** and **Spring Boot** to process multichannel events, improving message routing reliability across bots, agent assist, and analytics systems.
- **Developed** a payload transformation library using reusable patterns, reducing integration effort by **40%** across teams.

PROJECTS

- **Event Bus Library**—Designed a distributed cache invalidation framework (Java, RabbitMQ, Maven), **adopted by 7 teams** and handling **1000+ cache events/sec**, ensuring cache consistency across microservices.
- **Snowflake ID Generator**—**Built** a high-throughput ID service (Zookeeper, Spring Boot) generating **4096 IDs/ms**, ensuring ordered, globally unique ID generation for distributed systems workloads.
- **Consistent Hashing Library**—Implemented **Murmur3 + ordered map-based** scalable key distribution with Builder Pattern, **reducing load divergence by 67%**, now deployed in production for uniform request **routing** across services.

EDUCATION

B.E. in Computer Science and Engineering, **Jadavpur University**, Kolkata—**CGPA: 8.62/10** | August 2017–August 2021

ACHIEVEMENTS AND CERTIFICATES

- Solved **1250+** coding problems (**LeetCode 670+**, **GeeksforGeeks 420+**, **HackerRank 100+**).
- Rated **6 stars** on **HackerRank** (Algorithms and DSA) and **4th place** in the Codechef **February Long Challenge 2021**
- **Certifications:** **HackerRank** (Intermediate), **GeeksforGeeks** (Placement 100).
