PROFESSIONAL SUMMARY

Senior Backend Engineer with 5+ years building event-driven distributed systems in Java. Owns 15+ production microservices on an RCS messaging platform serving 1,500+ enterprise clients at 2K msg/sec sustained (10K peak); deep in Kafka, RabbitMQ, Redis, and Kubernetes, with a record of cutting latency and infra cost on live production systems.

TECHNICAL SKILLS

Programming Languages: Java (primary), SQL, Python.

Databases & Caching: MySQL, NoSQL (Cassandra, Redis, MongoDB), Elasticsearch, ClickHouse, Database Optimization.

Backend & Messaging: Spring Boot, Spring Cloud, JPA, Hibernate, REST APIs, Kafka, RabbitMQ.

Cloud and DevOps: Kubernetes, Docker, Helm, AWS (EC2, RDS, EKS, ElastiCache), Jenkins, CI/CD, Git, GitLab, Autoscaling.

Design and Architecture: Microservices, Event-Driven Architecture, Async Processing, Idempotency, CQRS, API Gateway, Fault Tolerance, Scalability, Circuit Breaker, OAuth, JWT.

Observability & Reliability: Splunk, Prometheus, Grafana, Performance Tuning, Distributed Tracing.

PROFESSIONAL EXPERIENCE

Gupshup Technology Pvt. Ltd. | Bengaluru, India

Senior Software Engineer 1 | June 2026 – Present

- **Architected and owns** the RCS platform end-to-end — onboarding, template manager, messaging, and billing — using RabbitMQ for per-message delivery and retry, Kafka for batch ingest, and Redis session state; **authored 10+ design docs**.
- **Migrated** the RCS config service from ZooKeeper to MySQL, removing a single point of failure behind **4 production incidents (~30 min each)** and 4 ZooKeeper nodes; rebuilt config propagation using RabbitMQ.
- **Mentored 8 junior engineers** and reviewed 500+ PRs, driving design walkthroughs and testing practices across the platform team; 3 promoted to SDE-2 within 18 months.

Software Development Engineer 2 | June 2023 – May 2026

- **Led a large-scale**, zero-downtime migration of **1,000+ enterprise clients across India and international markets** from a legacy platform to a modern, scalable architecture, ensuring backward compatibility, template validation, data integrity, and seamless production rollout.
- **Cut average API latency 67% (60 ms → 20 ms)** on the conversation-billing path by moving MySQL and callback dispatch off the request thread and replacing JSON session payloads with compact key encoding.
- **Led the design** of a real-time chat system across 8 teams (WebSocket + RabbitMQ pub-sub); resolved persistent node hot-spotting by adding virtual nodes to the consistent-hashing ring, cutting connection imbalance **by 67%**.
- **Reduced AWS infrastructure costs by \$58K/year** through resource optimization, including instance right-sizing, termination of idle workloads, and standardized golden images.

Software Development Engineer 1 | June 2021 – May 2023

- **Resolved** a critical **RabbitMQ consumer** reconnection issue through root cause analysis; implemented resilient consumer recovery, idempotent message processing, retry mechanisms, and DLQ handling, eliminating a **30-minute** processing backlog and improving messaging reliability.
- **Launched** self-serve onboarding for Instagram and Google Business Messaging, partnering with product and partner-facing teams from requirements to rollout (JAX-RS, RabbitMQ, MySQL) — cutting client **onboarding time 70%** and removing engineering from the onboarding loop.
- **Developed** a payload transformation library using reusable design patterns, reducing integration effort by **40%** across teams.

PERSONAL PROJECTS

- **Event Bus Library**—Created a **RabbitMQ-based** event bus in Java for cache invalidation and cross-service event propagation. Designed topic exchanges, routing-key and queue-binding strategies, and implemented publisher confirms, consumer acknowledgments, and idempotent processing. **Adopted by 5+ teams**, processing 1,000+ events/sec while improving cache consistency and messaging reliability across microservices.
- **Job Emailer**—Generative AI Automation (**Java, Spring Boot, Gemini API**): Built an LLM agent turning LinkedIn job posts into personalized recruiter emails and DMs, using schema-constrained prompts with profile grounding. Added cascading key/model failover with a rule-based fallback for zero-downtime generation — cutting per-application effort **~70%**.

EDUCATION

B.E. in Computer Science and Engineering, **Jadavpur University**, Kolkata—**CGPA: 8.62/10** | August 2017–August 2021

ACHIEVEMENTS AND CERTIFICATES

- **Solved 1350+** coding problems across LeetCode (700+), GeeksforGeeks (420+), and HackerRank (100+); achieved 6★ on HackerRank and secured 4th place in CodeChef February Long Challenge 2021.
- **Consistently rated 4★+ in performance reviews at Gupshup over the last two years.**
